The diagram illustrates a transmitting apparatus 10A, which is divided into two main functional blocks: an STS CROSS-CONNECT UNIT and a VT CROSS-CONNECT UNIT (20A).

**STS CROSS-CONNECT UNIT:**

- BRANCH POINT (24):** This is the central hub where signals from multiple tributaries are combined. It receives inputs from tributaries 30<sub>1</sub> through 30<sub>n</sub> (each passing through an INF block) and from the STS TSI unit (12).
- STS TSI (11) and STS PSW (15):** These units process the combined signal from the branch point. The STS TSI (11) outputs to the STS PSW (15).
- 2:1 SEL (16):** A selector unit that receives inputs from the STS PSW (15) and the tributaries 40<sub>1</sub> through 40<sub>n</sub> (each passing through an INF block). It selects between these inputs based on the STS PSW signal.
- TRIBUTARY (40<sub>1</sub> to 40<sub>n</sub>):** These are the output lines from the 2:1 SEL unit, each passing through an INF block before being sent to the WEST or EAST direction.

**VT CROSS-CONNECT UNIT (20A):**

- STS TSI (12) and STS TERMINATION UNIT (14):** The STS TSI (12) receives input from the branch point (24) and outputs to the STS TERMINATION UNIT (14).
- VT SOL (21), VT TSI (22), and VT PSW (23):** These units are part of the VT cross-connect logic. The VT SOL (21) receives input from the STS TERMINATION UNIT (14) and outputs to the VT TSI (22), which then outputs to the VT PSW (23).
- VT CROSS-CONNECT UNIT (20A):** This unit is responsible for managing the VT signals, including the VT SOL, VT TSI, and VT PSW, and their connection to the STS TSI (12) and the STS PSW (15).
